Flawless Tracking Setup

CEO Turbo · ceoturbo.com · Google, Meta and Microsoft Ads · booked calls and Shopify review-card purchases

How your data flows

Conversion	Where it happens	Meta	Google (GA4 + Ads)	Microsoft Ads	Google Sheet tab
Free check lead	/free-audit	Lead (browser + server)	generate_lead (GA4 direct tag + Ads via GTM)	submit_lead_form	Free Check Leads
Booked call	Cal.com on your site	Schedule (browser + server)	book_call (GA4 direct tag + Ads via GTM)	book_appointment	Booked Calls
Card purchase	Shopify checkout	Purchase (Facebook & Instagram app)	purchase (Shopify custom pixel)	purchase (Shopify custom pixel)	Card Orders

Every lead keeps its ad click IDs (gclid, msclkid, fbclid) and UTMs in the sheet, so you can see which ad produced it.

0. Already done

- ✔ Tracking code live on ceoturbo.com: GTM, Meta Pixel (3232222473609236), Microsoft UET hook, server-side Meta events.
- ✔ Meta Conversions API token added in Vercel (`META_CAPI_TOKEN`); ceoturbo.com domain verified in Meta.
- ✔ Cal.com webhook created: Booking Created → `https://www.ceoturbo.com/api/cal-webhook` (signature tested live).
- ✔ Google Sheet "FREE Lead Magnet Leads": three tabs, Apps Script live, locked to the owner only. Free check and order-request rows tested.
- ✔ Shopify paid-order endpoint built: `/api/shopify-webhook` (needs step 6.2 below).

1. Meta (Events Manager)

1.1 Pixel settings (Events Manager → your pixel → Settings)

- ☐ Track events automatically without code: **Off**.
- ☐ Automatic events (AI): **Off**. Your own code sends exact events; these would add guesses and duplicates.
- ☐ Automatic advanced matching: **On**.

1.2 Shopify connection

- ☐ Shopify admin → Apps → **Facebook & Instagram** → connect pixel 3232222473609236. Data sharing: **Maximum**.
- ☐ This app is the **only** thing that sends Meta "Purchase". Do not add Meta to the custom pixel or anywhere else in Shopify.

1.3 Check events arrive (Events Manager → Test events)

- ☐ Enter `ceoturbo.com` and open it: PageView, ViewContent appear.
- ☐ Run a free check with fake details: **Lead** appears twice (Browser + Server), marked deduplicated.
- ☐ Book a test call: **Schedule** appears twice (Browser + Server), deduplicated.
- ☐ Check "Event match quality" later in Overview. Aim for Good or better on Lead, Schedule and Purchase.

1.4 Campaign setup

- ☐ Agency ads: conversion event = **Schedule** (use **Lead** while you have few bookings per week).
- ☐ Card ads: conversion event = **Purchase**.

- ☐ Send ads to your own booking page (ceoturbo.com/brand-boost or /book), **not** the raw cal.com link.
- ☐ URL parameters on every ad: `utm_source=meta&utm_medium=paid&utm_campaign={{campaign.name}}&utm_content={{ad.name}}`

2. Google Analytics 4

- ☐ analytics.google.com → Admin (gear) → Data streams → your website stream (create one for ceoturbo.com if none).
- ☐ Copy the **Measurement ID** (`G-…`). **SEND ME**
- ☐ On the stream: Configure tag settings → **Configure your domains**. Add conditions "contains": `ceoturbo.com` and your Shopify checkout domain (`uweee2-sc.myshopify.com` , plus your custom checkout domain if you have one).
- ☐ Admin → Product links → **Google Ads links** → link your Ads account.
- ☐ Admin → Events: after your first test, mark `book_call` , `generate_lead` and `purchase` as **Key events**.

3. Google Ads

3.1 Account basics

- ☐ Admin → Account settings → **Auto-tagging: On** (this adds the gclid that every lead needs).
- ☐ Goals → Settings → **Enhanced conversions for web: On**, method **Google Tag Manager**.

3.2 Create three conversion actions

Goals → Conversions → Summary → + Create conversion action → Website. For each, choose **Use Google Tag Manager** and copy the Conversion ID and Label.

Name	Category	Value	Count	Primary?
Booked call	Book appointment	Don't use a value	One	Yes
Lead	Submit lead form	Don't use a value	One	Secondary (or Primary if you want to optimise for leads)
Purchase	Purchase	Use different values	Every	Yes

- ☐ Booked call: Conversion ID (digits after `AW-`) **SEND ME** and label **SEND ME**
- ☐ Lead label **SEND ME**
- ☐ Purchase label: choose "Use Google tag → Install the tag yourself" and copy the part after the slash in `AW-…/LABEL`. **SEND ME**

3.3 Campaign settings

- ☐ Campaign goal conversions: Booked call (and Purchase for card campaigns).
- ☐ Tracking template (Account or Campaign level): `{lpurl}?utm_source=google&utm_medium=cpc&utm_campaign={campaignid}&utm_term={keyword}`
- ☐ Final URL: your own booking page, not the raw cal.com link.

4. Microsoft Advertising

- ☐ ads.microsoft.com → Tools → **UET tag** → Create (name it "CEO Turbo") → copy the **Tag ID**. **SEND ME**
- ☐ In Vercel, add `VITE_UET_TAG_ID` with that number (Production), then Redeploy.
- ☐ Tools → **Conversion goals** → **Create** → **Website** → **Event**. Make three goals. The **Action** text must match exactly or the goal never records:

Goal name	Action equals	Revenue
Booked call	`book_appointment`	No revenue
Lead	`submit_lead_form`	No revenue
Purchase	`purchase`	Revenue varies

- ☐ When asked how the tag is installed, choose the option saying it's already installed.
- ☐ Turn on **Enhanced conversions** in the conversion settings when offered.
- ☐ Account settings → **Auto-tagging: On** (adds the msclkid).
- ☐ Campaign URL options (tracking template): `{lpurl}?utm_source=bing&utm_medium=cpc&utm_campaign={Campaign}&utm_term={keyword}`
- ☐ Allow up to 24 hours for conversion data to appear.

5. Google Tag Manager (container GTM-KRPRZ67Z)

I fill your IDs into the container file once you send them. Then you import it:

- ☐ tagmanager.google.com → open GTM-KRPRZ67Z → Admin → **Export Container** (backup).
- ☐ Admin → **Import Container** → `docs/gtm-container.json` → Existing workspace → **Merge** → "Rename conflicting tags, triggers, variables" → Confirm.
- ☐ Variables: set Const Google Ads Conversion ID and the two Ads labels (Booked call, Lead) if I haven't already. **GA4 is not in GTM**: it is installed directly on the site (G-XDWPSVBW53), so never add a Google tag or GA4 tag to the container.
- ☐ Enhanced conversions: create a **User-Provided Data** variable (Manual configuration): Email = dataLayer `user_data.email`, Phone = `user_data.phone_number`. In both Google Ads tags, tick "Include user-provided data" and choose it.
- ☐ **Preview** → enter https://www.ceoturbo.com → book a test call and run a free check. "Google Ads – Booked call" fires once on `book_call`; "Google Ads – Lead" once on `generate_lead`.
- ☐ Make sure there is **no** Meta or Microsoft tag in the container (the site already fires them; adding them double counts).
- ☐ **Submit** → **Publish.**

6. Shopify (review-card purchases)

6.1 Purchase tracking for Google and Microsoft (custom pixel)

- ☐ Shopify admin → Settings → **Customer events** → **Add custom pixel** → name "CEO Turbo purchase".
- ☐ Paste `docs/shopify-custom-pixel.js` after I've filled in the four IDs (GA4 ID, Ads ID, Purchase label, UET tag ID). Save → **Connect**.
- ☐ Do **not** install the Google & YouTube app (it would send a second purchase).

6.2 Paid orders into your Google Sheet (webhook)

- ☐ Shopify admin → Settings → **Notifications** → **Webhooks** → **Create webhook**.
- ☐ Event: **Order payment**. Format: **JSON**. URL: `https://www.ceoturbo.com/api/shopify-webhook`. Latest API version. Save.
- ☐ At the top of the Webhooks page, copy the **signing secret** into Vercel as `SHOPIFY_WEBHOOK_SECRET` (Production), then **Redeploy**.
- ☐ Use "Send test notification". Orders then appear on the **Card Orders** tab as "Paid order".

6.3 Product and store setup

- ☐ Follow `docs/shopify-listing.md`. The site's Buy button needs the Pack variants to exist in Shopify.

7. Vercel environment variables (Production, then Redeploy)

Variable	Status	Where it comes from
META_CAPI_TOKEN	Done	Meta Events Manager → Conversions API
CAL_WEBHOOK_SECRET	Done	Your own string, same as in the Cal.com webhook
LEADS_WEBHOOK_URL	Done	Apps Script Web app URL (ends /exec)
LEADS_WEBHOOK_SECRET	Done	Same string as the SECRET line in the Apps Script
VITE_UET_TAG_ID	**To do**	Microsoft Ads UET tag ID (section 4)
SHOPIFY_WEBHOOK_SECRET	**To do**	Shopify webhook signing secret (section 6.2)
META_TEST_EVENT_CODE	Only while testing	Events Manager → Test events. Delete afterwards.

8. Final test (about 20 minutes)

Do this	You should see
Run a free check with fake details	Row in Free Check Leads · Meta Lead ×2 (Browser + Server) · GTM Lead tag once · Google Ads Lead conversion within a few hours
Book a test call on the website's booking page	Row in Booked Calls with phone and meeting link · Meta Schedule ×2 · GTM Booked call tag once · Google Ads and Microsoft conversion (up to 24 h)
Place a real $24.99 card order, then refund it	Meta Purchase · GA4 purchase (Realtime) · Google Ads and Microsoft purchase · row in Card Orders (Paid order) with ship-to and ad source
Click a test ad or add `?gclid=TEST&utm_source=google` to a page URL, then submit a form	The sheet row shows the source and click ID

- ☐ When everything passes: delete `META_TEST_EVENT_CODE` in Vercel and Redeploy; delete the TEST rows in the sheet.
- ☐ Delete the Cal.com API key (Cal.com → Settings → Developer → API keys) and rotate any secret you pasted into chat.

9. Keep it accurate

- ☐ Weekly: compare Google Ads / Microsoft / Meta conversion counts with your Booked Calls tab. Small differences are normal; big gaps mean a tag broke.
- ☐ Booked calls from the raw cal.com link are counted by Meta and your sheet (webhook) but **not** by Google or Microsoft. Always send ad traffic to your own booking page.
- ☐ If you run ads to the EU, UK or California, add a cookie consent banner. It isn't set up yet.
- ☐ Your Google Sheet and Apps Script stay private: keep sharing "Restricted" and use 2-step verification on the owner account.

What I need from you

Item	Looks like
GA4 Measurement ID	`G-XXXXXXXXXX`
Google Ads conversion ID	digits after `AW-`
Labels: Booked call, Lead, Purchase	three short codes

Microsoft UET tag ID	a number

Paste those in the chat (they are IDs, not passwords) and I'll finish the GTM file and the Shopify pixel and push them to main.
